

## Instructions:

You are tasked with creating a simple ReactJS app that allows users to search for images and display them on the screen. You will be using the **Unsplash API** to fetch images.

## Requirements:

1. The app should consist of two components:
  - a. **SearchBar**: component that allows users to enter a search term and submit.
  - b. **ImageList**: component that displays the images returned from the API.
2. When the user enters a search term in the SearchBar and submits it, the app should fetch images from the Unsplash API based on that search term and display them in the ImageList component.
3. The ImageList component should display each image along with its name and a link to the Unsplash page for that image.
4. The app should be responsive and work on both desktop and mobile devices.
5. You can use any additional libraries or tools you deem necessary.

## Submission Guidelines:

1. Please submit your code in a GitHub repository.
2. Include a README file with instructions on how to run your app.
3. Additional points for providing a live demo of your app, either by deploying it to a web hosting service or by providing a video demonstration.
4. Include any additional comments or notes you feel are relevant.

Good luck!
